

A word about OCR Accuracy

OCR technology is not perfect. Unfortunately, 100% OCR accuracy does not exist in the real world. OCR technology is a computing resource intensive process. The OCR engine uses complex mathematical algorithms, and pattern recognition to produce the text file output. In many cases, optimizing the OCR engine settings can help in one case but it does not in another. A given change fixes one problem but creates another.

iScan will make every effort to produce accurate OCR results, but can not guarantee 100% results. Customer must use word processing software to edit the OCR text file, and correct misspelled words. This is the only method that can guarantee the highest accuracy rate.
